

ABSTRACT OF THE DISCLOSURE

An apparatus for reproducing data comprises a reproduction device, a detection device and a subsequent processing-execution device. The reproduction device receives a data constellation, which includes
5 content data and control data for controlling reproduction of the content data, and reproduces the content data based on the control data. The detection device detects whether or not the reproduction of the content data by means of the reproduction device is to be halted based on the control data. The subsequent processing-execution device executes a
10 subsequent processing as previously set, when the detection device obtains detection results that the reproduction of the content data by means of the reproduction device is to be halted.
